DOMAIN: THIS INHIBITOR CONTAINS THREE INHIBITORY PTM: O-GLYCOSYLATED.
SIMILARITY: BELONGS TO THE BPTI/KUNITZ FAMILY OF HIGHLY SIMILAR TO TFP2.
                                                                                                                                                                                                           protease inhibitor;
                                                                                                                                                                                             3D-structure

"Characterization of cDNA encoding a human sperm membrane protein related to A4 amyloid protein.";

Proc. Natl. Acad. Sci. U.S.A. 87:2405-2408(1990).

-!- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

-!- ALTERNATIVE PRODUCTS: 4 ISOFORMS; A (SHOWN HERE), B, C AND D;

-RE PRODUCED BY ALTERNATIVE SPLICING.

-!- SIMILARITY: CONTALNS A PROTEASE INHIBITOR DOMAIN BELONGING TO THE BPTI/KUNITZ FAMILY OF INHIBITORS.

-!- SIMILARITY: BELONGS TO THE APP FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       APP2_RAT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        inhibits, e.g. trypsin, kallikrein, plasmin and spinal cord Bikunin can be used to treat or prevent brain and spinal cord Bikunin can be used to treat or prevent brain and spinal cord Bikunin can be used to treat or prevent brain and spinal cord became, inflammation, infection or granulomatosis, multiple sclerosis, ischaemila, perioperative blood loss, sepsis, shock, fibrosis, blood coagulation diseases, polytrauma, stroke, fibrosis, blood coagulation diseases, polytrauma, stroke, cerebral or subarachnoid haemornhage and gastric or cervical cerebral or subarachnoid haemornhage and gastric or cervical cancer and prevent metastasis. It is particularly useful for cancer and prevent metastasis. It is particularly useful for reat reducing blood loss during surgery, and can also be used to treat reducing blood loss during surgery, and can also be used to treat reducing blood loss during surgery, and can also be used to treat reducing blood loss during surgery, and can also be used to treat reducing blood loss during surgery, and can also be used to treat reducing blood loss during surgery, and can also be used to treat reducing blood loss during surgery, and can also be used to treat reducing blood loss during surgery, and can also be used to treat reducing blood loss during surgery.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            other cancer, arthritis, anaemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and gout, and prevent pre-term labour. It has similar properties to approtinin, but is less highly charged so should be less immunogenic and less likely to damage the kidneys. Manipulation of the bikunin sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor blood or blood products during surgery, thereby reducing the risk of infection and other adverse side effects, as well as reducing the cost of surgery.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New human placental bikunin - used to etc. in treatment of oedema, multiple perioperative blood loss

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Вþ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa. inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa. Bikunin can be used to treat or prevent brain and spinal cord codema, inflammation, infection or granulomatosis, multiple oedema, inflammation, infection or granulomatosis, multiple codema, inflammation, perioperative blood loss, sepsis, shock, if it is particularly useful for cancer and prevent metastasis. It is particularly useful for reducing blood loss during surgery, and can also be used to treat influenza and similar viral infections, acute pancreatitis and continuous content of the similar viral infections, acute pancreatitis and influenza and similar viral infections, acute pancreatitis and continuongenic and less highly charged so should be less immunogenic and less likely to damage the kidneys. Manipulation of the bikunin sequence may allow the inhibitory profile to be blood or blood products during surgery, thereby reducing the risk of infection and other adverse side effects, as well as reducing

Bikunin can be used to treat or prevent brain and spinal cord codema, inflammation, infection or granulomatosis, multiple sclerosis, ischaemia, perioperative blood loss, sepsis, shock, cerebral or subarachnoid haemorrhage and gastric or cervical cancer and prevent metastasis. It is particularly useful for reducing blood loss during surgery, and can also be used to treat cother cancer, arthritis, anaemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and gout, and prevent pre-term labour. It has similar properties to immunogenic and less likely to damage the kidneys. Manipulation of the bikunin sequence may allow the inhibitory profile to be blood or blood products during surgery, thereby reducing the risk the need for whole donor of infection and other adverse side effects, as well as reducing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; placental bikunin; inhibition; trypsin; kallikrein;

The present sequence is a human placental bikunin, which inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa.

Bikunin can be used to treat or prevent brain and spinal corpodema, inflammation, infection or granulomatosis, multiple sclerosis, blood coagulation diseases, polytrauma, stroke, cerebral or subarachnoid haemorrhage and gastric or cervical cancer and prevent metastasis. It is particularly useful for reducing blood loss during surgery, and can also be used to treat influenza and similar viral infections, acute pancreatitis and constituent and prevent pre-term labour. It has similar properties to immunogenic and less highly charged so should be less confirmed to the bikunin sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor of the creat of surgery.

It is particularly useful for cancer and prevent metastasis. It is particularly useful for other cancer, arthritis, anaemia, non-insulin dependent diabetes, influenza and similar viral infections, acute pancreatitis and influenza and prevent pre-term labour. It has similar properties to gout, and prevent pre-term labour. It has similar properties to aprotinin, but is less highly charged so should be less aprotinin, but is less highly charged so should be less of the bikunin sequence may allow the inhibitory profile to be of the bikunin sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor altered. It also reduces or eliminates the need for whole donor blood or blood products during surgery, thereby reducing the risk of infection and other adverse side effects, as well as reducing

The present sequence is a consensus human bikunin, which inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa. Inhibits, e.g. trypsin, kallikrein, plasmin and spinal cord sedema, inflammation, infection or granulomatosis, multiple coedema, inflammation, infection or granulomatosis, multiple selerosis, ischaemia, perioperative blood loss, sepsis, shock, fibrosis, blood coagulation diseases, polytrauma, stroke, cerebral or subaracchnoid haemorrhage and gastric or cervical coancer and prevent metastasis. It is particularly useful for cancer and revent netastasis. It is particularly useful for cerducing blood loss during surgery, and can also be used to treat influenza and similar viral infections, acute pancreatitis and gout, and prevent pre-term labour. It has similar properties to aprotinin, but is less highly charged so should be less influenza and less likely to damage the kidneys. Manipulation of the bikunin sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       W30060 standard; Protein; 235 AA.

It is particularly useful for reducing blood loss during surgery, and can also be used to treat other cancer, arthritis, anaemia, non-insulin dependent diabetes influenza and similar viral infections, acute pancreatitis and gout, and prevent pre-term labour. It has similar properties to aprotinin, but is less highly charged so should be less immunogenic and less likely to damage the kidneys. Manipulation of the bikunin sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor of infection and other adverse side effects, as well as reducing of infection and other adverse side effects, as well as reducing the ris

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is a consensus human bikunin, which control inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa. Elikunin can be used to treat or prevent brain and spinal cord coedema, inflammation, infection or granulomatosis, multiple coedema, inflammation, infection or granulomatosis, multiple coedema, inflammation, infection or granulomatosis, sepsis, shock, coefficients, blood coagulation diseases, polytrauma, stroke, cerebral or subarachnoid haemorrhage and gastric or cervical cancer and prevent metastasis. It is particularly useful for cancer, arthritis, anaemia, non-insulin dependent diabetes, comporting blood loss during surgery, and can also be used to treat comportance, arthritis, anaemia, non-insulin dependent diabetes, comportinin, but is less highly charged so should be less caprotinin, but is less highly charged so should be less coefficient and less likely to damage the kidneys. Manipulation to the bikunin sequence may allow the inhibitory profile to be coefficient and considered in the constant of the component of the component of the component cancer of eliminates the need for whole donor constant of the constant of t

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is a human placental bikunin, which conhibits, e.g. trypsin, kallikrein, plasmin and factor XIIA. Bikunin can be used to treat or prevent brain and spinal cord coedema, inflammation, infection or granulomatosis, multiple codema, inflammation, infection or granulomatosis, multiple coedema, inflammation, infection or granulomatosis, block, coerebral or subarachnoid haemorinage and gastric or cervical cerebral or subarachnoid haemorinage and gastric or cervical creducing blood loss during surgery, and can also be used to treat cother cancer, arthritis, anaemia, non-insulin dependent diabetes, confluenza and similar viral infections, acute pancreatities and could not prevent pre-term labour. It has similar properties to compose the properties to the compose of the bikunin sequence may allow the inhibitory profile to be confluenced. It also reduces or eliminates the need for whole donor the blood products during surgery, thereby reducing the risk confluence and other adverse side effects, as well as reducing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence comprises a novel protein, designated HAI-II, that inhibits the protease activity of hepatocyte growth factor (HGF) activator. The sequence was deduced from a cDNA clone (T61439) obtained from cancer cell line MKN45. Also claimed HAI-II, a vector carrying this DNA, and a host cell, pref. an animal cell, transformed with the vector. HAI-II can be used for regulating HGF activator activity (and thus HGF activity) in vitro and in vivo. It may also be used for investigating the function of HAI-II in vivo and the effect of HAI-II in hepatic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                121 RWYFDVERNSCNNEIYGGCRGNKNSYRSEEACMLRCFRQQENDPLPLGSK 170

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents a human tissue factor pathway inhibitor-3 (TFPI-3) which contains two kunitz type domains. The invertion also provides the TFPI-3 cDNA and screening methods for identifying agonists and antagonists of TFPI-3. As TFPI-3 inhibits in the provides activity, it is claimed to be useful for, e.g. inhibiting in travascular clotting and preventing the formation of fibrin clots both in vitro and in vivo, for treating coronary occlusion with acute myocardial infarction and in the prophylaxis and treatment of peripheral arterial embolism, for the treatment of sepsis, inflammatory as an anticoaggulant in blood transfusions, extracorporeal circulation, and dialysis procedures and in blood samples for laboratory purposes. The TFPI-3 antagonists are claimed to be useful for promoting coagulation, e.g. in the treatment of haemophilia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches

The present sequence is a human placental bikunin, which control inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa. CC inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa. CC element in flammation, infection or prevent brain and spinal cord coedema, inflammation, infection or granulomatosis, multiple cc cerebral or subarachnoid haemorrhage and gastric or cervical cc cerebral or subarachnoid haemorrhage and gastric or cervical cc cancer and prevent metastasis. It is particularly useful for cancer and prevent metastasis. It is particularly useful for conter cancer, arthritis, anaemia, non-insulin dependent diabetes, other cancer, arthritis, anaemia, non-insulin dependent to treat creditions and similar viral infections, acute pancreatitis and court, and prevent pre-term labour. It has similar properties to gout, and prevent pre-term labour. It has similar properties to immunogenic and less likely to damage the kidneys. Manipulation in the bikunin sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor content of the bikunin sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor of infection and other adverse side effects, as well as reducing the risk content of the content of th

The present sequence is a human placental bikunin, which controlled inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa. Condition of the bikunin can be used to treat or prevent brain and spinal cord coedema, inflammation, infection or granulomatosis, multiple coedema, inflammation, infection or granulomatosis, multiple coedema, inflammation, perioperative blood loss, sepsis, shock, coefibrosis, blood coagulation diseases, polytrauma, stroke, coefibrosis, blood coagulation diseases, polytrauma, stroke, coefibral or subarachnoid haemorihage and gastric or cervical coeficer and revent metastasis. It is particularly useful for cancer and prevent metastasis. It is particularly useful for coefficient and loss during surgery, and can also be used to treat reducing blood loss during surgery, anon-insulin dependent diabetes, other cancer, arthritis, anaemia, non-insulin dependent diabetes, comporting the rest of the particularly properties to gout, and prevent pre-term labour. It has similar properties to gout, and prevent pre-term labour. It has similar properties to comport the particularly profile to be comported and less likely to damage the kidneys. Manipulation comporties and less likely to damage the kidneys. Manipulation comporties to be altered. It also reduces or eliminates the need for whole donor comporties of surgery. Thereby reducing the risk component of the cost of surgery.

                     inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa.
Bikunin can be used to treat or prevent brain and spinal cord
codema, inflammation, infection or granulomatosis, multiple
sclerosis, blood coagulation diseases, polytrauma, stroke,
cerebral or subarachnoid haemorrhage and gastric or cervical
cancer and prevent metastasis. It is particularly useful for
reducing blood loss during surgery, and can also be used to treat
influenza and similar viral infections, acute pancreatitis and
gout, and prevent metastasis. It has similar properties to
cother cancer, arthritis, anaemia, non-insulin dependent diabetes,
gout, and prevent pre-term labour. It has similar properties to
cimmunogenic and less highly charged so should be less
of the bikunin sequence may allow the inhibitory profile to be
altered. It also reduces or eliminates the need for whole donor
cof infection and other adverse side effects, as well as reducing
the risk
the cost of surgery.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               04-OCT-1996;

The present sequence is a human placental bikunin, which inhibits, e.g. trypsin, kallikrein, plasmin and factor XIIa. Bikunin can be used to treat or prevent brain and spinal cord cedema, inflammation, infection or granulomatosis, multiple sclerosis, ischaemia, perioperative blood loss, sepsis, shock, cerebral or subarachnoid haemorrhage and gastric or cervical concer and prevent metastasis. It is particularly useful for ceducing blood loss during surgery, and can also be used to treat influenza and similar viral infections, acute pancreatitis and concertant prevent pre-term labour. It has similar properties to immunogenic and less highly charged so should be less of immunogenic and less likely to damage the kidneys. Manipulation concertant in sequence may allow the inhibitory profile to be altered. It also reduces or eliminates the need for whole donor concerts during surgery, thereby reducing the risk of infection and other adverse side effects, as well as reducing
